WALL DRAWING

Soundinstallation for 2 cd-players and 4 loudspeakers

Score (how to perform "wall drawing")

Static white noise is split with a filter into two portions. Portion 1 contains all frequencies between 15 and 1660Hz. Portion 2 contains all frequencies between 1660 and 20.000Hz. Produce a CD with each of the two sounds (for example 70 minutes each CD). Put 2 loudspeakers in the front part of the chosen room, hang 2 other loudspeakers at the rear part of the room (according to the photo). The CD-player with the low frequencies is heard at the loudspeakers in the low position, the CD-player with high frequencies is heard at the loudspeakers in the high position. Play loud but ballanced. Choose repeat-function for endless play.
